

By manually turning the axis position of the argenta Pivotica Pro (100 or 150), a door leaf can be inserted crosswise into the door opening.

After manually turning the axis position at 90°, the applied direction of rotation must be respected for the crosswise placement of a door leaf. The letters 'HO' are engraved on the axis point and serve as a reference point for the correct positioning of the door leaf.

The schematic diagram below helps to position the door leaf correctly in function of the above description.
